Dear Feed Mill Owner/Operators:

Please find the Illinois Department of Agriculture's Mycotoxin Survey results. We are sharing these important survey results as part of the department's commitment to insure that all animal feeds produced in the state are of the highest quality. This survey report shows the range of detection levels of aflatoxin, fumonisin and vomitoxin found in corn during the harvest season. If the survey results show elevated levels of these mycotoxins in your area, the department recommends additional testing of corn utilized in your feed operation to avoid any potential injury to your livestock production customers.

Mycotoxins continue to pose a serious threat to the health or even death of livestock. Additional testing is one more tool to be employed for the protection of the various animal groups in the state.

Sincerely,

A handwritten signature in black ink, appearing to read "Bruce C. Kuback".
